

Overall, the application successfully meets user requirements by providing an intuitive interface and a clear, space-themed design. When users first enter the website, it is quite apparent what actions can be taken. The overall layout and theming for the Planetarium and space background on the homepage create an engaging user experience.

However, a few bugs remain that need to be resolved to achieve full functionality. From acceptance testing, it was discovered that certain edge cases for registration, as well as the moon and planet creation user stories, are not fully fulfilled. Additionally, the homepage layout and formatting could be improved to further enhance clarity and ease of use. For example, planets having an owner id is unnecessary and circular since it doesn't add new information and causes confusion. The fact that moons can have the same ID as planets is also a potential area of confusion. For example, "Luna" has an ID of 1 and owner ID of 1, which users could misinterpret to mean its owner is itself rather than Earth which also has an ID of 1. Restructuring the way information is presented on the homepage would help the content be more organized, for example maybe creating separate tables for table and moon.
